

Browse by Addressee README

Adrian S. Wisnick, 8 May 2015

A. Two Mockups

There are two mockups. The first shows the starting Browse by Addressee page. The second shows the sort list of addressee results when a user selects an addressee.

B. The starting Browse by Addressee page

The first mockup page combines information from the MODS records (addressee/dates and short biography) with a count of items (in parentheses) related to each addressee.

C. The sorted list of Addressee results

Once users selected an addressee, they would be taken to the page represented in the second mockup.

The table at right is exactly the same as the Browse by Standard Catalogue Record except the last column now is addressee (rather than repository). The full view of the table would be the same as the full Browse by Standard Catalogue Record (see mockups for that page).

The column at left should be self-explanatory. The “Return to Full Addressee” link would take users back to the original full list of addressees and biographies.

D. Lazyload

Only 10 or so records appear in both mockups for this page, but we'd like users to be able to continue scrolling down as needed.
